WBP Plywood

WBP is a glue standard that was developed in Great Britain and is set down in British Standards Institution standard 1203:1963, "Specification for synthetic resin adhesives (phenolic and aminoplastic) for plywood." This standard identifies four categories of plywood glue on the basis of durability. WBP is the most durable classification. In descending order of durability, the other glue classes are Boil-Resistant, or BR; moisture-resistant, or MR; and interior, or INT. According to the Food and Agricultural Organization of the United Nations, properly formulated WBP plywood is the only plywood recommended for exterior use without reservation.
